

DeReddit

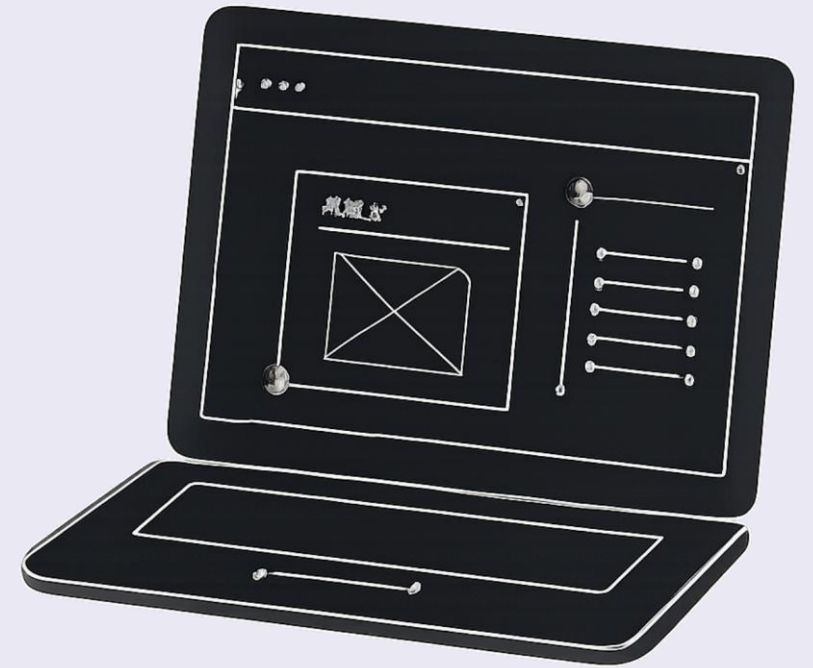

A Reddit-like decentralized application combining trustless smart contracts with Web2-speed performance.

High-Level Architecture

Live Demo

Walkthrough of the DeReddit platform

Main Challenges

1 Minimizing Gas Costs While Preserving Data Integrity

```
struct Forum {  
    uint256 id;  
    string name;  
    Category category;  
    string descriptionCID;  
    string rulesCID;  
    address creator;  
    string[] tags;  
}
```

```
struct Forum {  
    uint64 minKarmaToFlag;  
    bool initialized;  
}
```

Main Challenges

- 2 Learning Languages, Technologies & Full Deployment Workflow
- 3 Resolving State & Karma Edge Cases
- 4 Making the DB Trustless

What Went Well?

Trustless Mirror Architecture

PostgreSQL mirror → faster reads & richer search;
Blockchain remains the source of truth

Complete Feature Delivery

All Must-Have & Secondary requirements + Media
Uploads (Nice-To-Have)

Modern & Simple UI

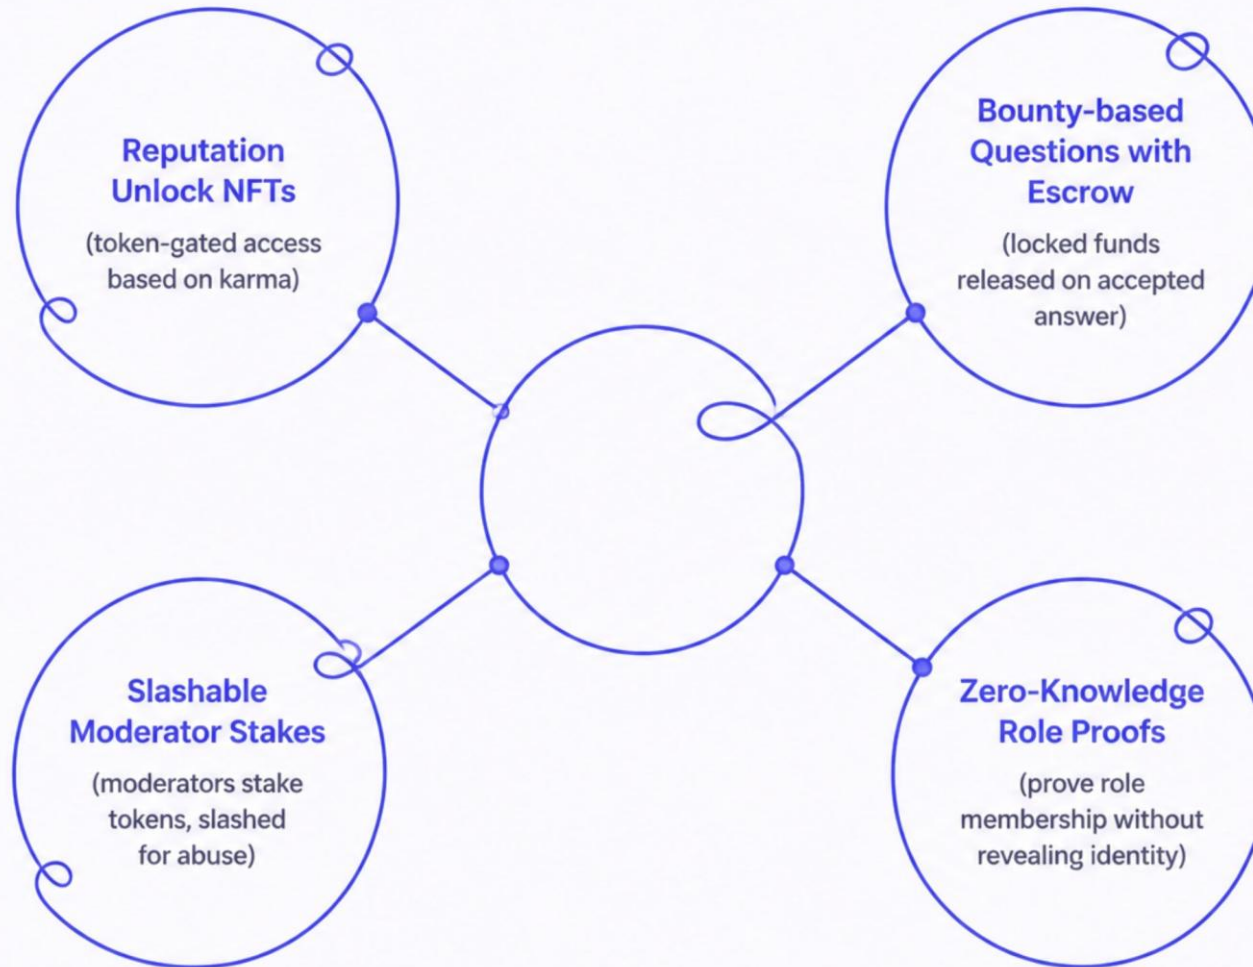

React + Mantine → responsive and user-friendly design

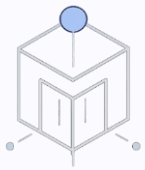

Streamlined Development

Unified setup for blockchain, indexer, database &
frontend

Potential Future Extensions

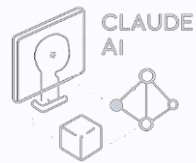

How Did We Use AI?

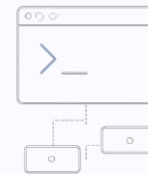

Gemini

Technology selection,
architecture reviews &
learning new concepts

Claude

SQL query generation and
API design review

Claude Code

Test generation, UI/UX
development, code review &
automation scripts

ChatGPT

Demo data generation for
realistic platform testing

Key Insights

AI is a Force Multiplier, But Review Remains Essential
